

Stock and Distribution Management

Warehouse management is becoming more and more complex. If you need to keep ahead of the game, then you must use proven and cost-effective systems to control your warehouse.

PSI Logistics supplies a modern software suite for stock and warehouse movement control, which seamlessly links the business processes and information flow. Using highly developed strategies, PSIwms minimises stock levels, optimises warehouse and employee utilisation, while maintaining flexibility. With a clear and proven user interface, the Stock Management System ensures that orders are processed on schedule, and commitments are met. The systems are also highly configur-

able, enabling them to match your requirements exactly. Picking, delivery route sequencing and packing are initiated using optimised routes and time-related factors.

A range of strategies with user configurable parameters ensure maximum efficiency in storage, retrieval and relocation. This leads to increased productivity and transparency in all warehousing and distribution facilities. Customers are becoming more demanding – particularly when linking to CRM processes. At the same time pick quantities are decreasing, with travel distances increasing. Product delivery often takes place via interconnected distribution networks.

PSI*wms* is all about top-class warehouse management. Optional expansion modules enable the software to support the entire distribution process, from shipment planning and transport capacity planning to optimisation of all aspects of the warehouse. This ensures a smooth transparent, and timely product flow throughout the supply-chain. This applies equally to B2C and B2B applications.

Main Functions include

- Goods in
 - Storage
 - Order processing
 - Goods retrieval
 - Picking
 - Shipment
 - Printing documentation
 - Inventory
- Statistics and reports
 - Management Documentation
 - Multiple client capability
 - Administration of
 - batches
 - best before dates
 - Quality Management
 - Bypass / Cross-docking
 - Administration of multiple storage areas
 - Interfaces
 - to higher-level IT systems such as SAP R/3, PSIPENTA and others
 - to lower-level truck control systems
 - to material flow control systems
